

1. Concerning the ethics of climate change, discuss some issues raised by the temporal fragmentation of agency, and why issues in this context are worse than other collective action problems (approx. 100 wds.)

The topic of climate change has for the last few years become a highly debated topic due to the fact that there has been sufficient evidence to show that more needs to be done in order to address the issue since failure to address the issue will result to the world experiencing numerous challenges that among others comprises of shortage of food supply. If the issue of climate change is not addressed, future generations will also have climatic problems. Indeed, climate change will result to increased extreme weather events all over the world in the near future and that will result to the economy been jeopardized. Moreover, the food supply will also be affected as changes in the weather pattern will negatively affect crop production.

2. Regarding the green energy revolution, even if such a revolution's claims don't totally undermine the "intergenerational storm," they still tends to obscure what is at stake, morally speaking, regarding climate change. Relate/explain important aspects concerning this issue (1approx.. 100 wds.)

The green energy revolution mainly aims at changing the type of energy used by people and ensuring that people normally use energy that is environmental friendly and has minimal negative impacts to the environment. Nevertheless, there are those who are opposed to the green energy revolution as they claim that the revolution is mainly

aimed at benefitting a select few who are producing the green energy. In addition, there are also those who are alleging that in some instances, the production processes of the green energy are not on their own green. Thus, there is a need to have a clear explanation of what makes the green energy green as it has been claimed by some quarters that the green energy even has more negative impact to the environment.

3. Calling upon ch. 3 in Jamieson as well as the article on "Denialism," reflect upon the issues/problems involved in factual denial, and in transforming moral arguments into factual ones (approx. 100 wds.)

When addressing the topic of climate change, the main issue that can be explained to act as a hindrance can be explained to be denial since even if people are aware of the devastating impact that climate change is to have on planet earth in some years to come, people tend to be of the opinion that the changes will take many years to have any impact hence the reason for no need of swift response to the situation. Indeed, it is the denial that can be said to be the reason why various stakeholders are normally not keen on implementing measures that would help address the issue.

4. Why does Jamieson argue that commonsense morality is poorly equipped to deal with the issue of climate change? (approx. 100 wds.)

From reading the views and opinions of Jamieson, it is evident that the reason why people have not been keen in addressing the issue of climate change has been due to the fact that people lack commonsense morality. Indeed, I concur with Jamieson that if

people had commonsense morality, they would consider the kind of earth that they are going to leave behind for their generations to come. Nevertheless, the fact that people are greedy and want to have everything for themselves can be said to be the reason why Jamieson alleges that commonsense morality is poor when it comes to the issue of climate change since if there was commonsense morality in place; the issue of climate change would be dealt with the seriousness that it deserves.

5. Explain why Jamieson feels that human rights concepts do not provide good analysis “tools” with which to consider issues related to climate change . (approx. 100 wds.)

According to Jamieson, human rights concepts do not offer good analysis tools with which to consider issues related to climate change since when it comes to human rights issues, people can be able to relate with the issues raised while on the other hand, when it comes to climate change, the issues that are raised are hard to envision as the main negative impacts of climate change are always alleged to be mainly experienced in the future in some years to come. Thus, it would therefore be incorrect for human rights concepts to be implemented in view of helping to address the climate changes issues.
